SCRIPT-CONTROLLED ACL

1. Brainstorming & Ideation

The project idea is to implement a script-controlled Access Control List (ACL) in ServiceNow to restrict users from viewing records unless they meet specific conditions.

The main concept is to control access to student/institution records according to the user's role and the value stored in the Branch field.

Key ideas: create users and custom roles; create the Institution Details custom table; store student and institution information; restrict unauthorized access; give administrators full access; and implement separate READ, CREATE, WRITE and DELETE ACLs.
