SCRIPT-CONTROLLED ACL

7. Project Documentation

Objective: Demonstrate how script-controlled ACLs in ServiceNow enforce record-level security based on user roles and field values.

Technologies used: ServiceNow, Access Control Lists, ServiceNow Roles, Custom Tables, ACL Scripts and Record-level Security.

Main components: users; roles bb1–bb4; u_institution_details table; Branch values ECE, EEE and CSE; and READ, CREATE, WRITE and DELETE ACL operations.

Security logic: roles and record conditions are evaluated to determine whether a user is allowed to perform a particular operation.
